In RailML, we have different attributes and elements for roles:

- "owner" in InfraAttrGroups and "ownerChanges", both used for tracks
- "manufacturer" and "operator" (element) for vehicles,
- "operator" (attribute) for trainParts

I think it would be wise to introduce a dedicated type for "roles" and provide slots for id references at the appropriate locations. Maybe a string enumeration type would work for the names of the different roles. Even better, we could provide container elements as used in the vehicle classification everywhere.

Regards

Andreas Tanner.
