Subject: class and type

Posted by Joachim.Rubröder   on Thu, 01 Feb 2007 12:58:01 GMT

Hello,
We started to use part of the rollingstock scheme for exchanging
rollingstock data via web service.

While generating a lot of classes and data types, we realised that the
vehicleType has a sub element "class". The operator has an attribute named
"class" as well and the manufacturer with the meaningless attribute "type"
like many other attributes in railML. This leads for example to generating
the class named "class", not forbidden but very confusing.

I therefore suggest to define a short list of forbidden names ("class",
"type", "element", "date" ...) and to rename the existing ones to
"classification", "operatorClass", "manufacturerType" and so on.

Kind regards
Joachim
