Hello,

after version 2.0 I have introduced the element <tilting> with its attributes "actuation", "maxTiltingAngle" and "tiltingSpeed".

With the new SBB twin deck trains for IC use there was a new kind of tilting - the roll compensation (Wankkompensation). Now it's the question whether there is the need for any revision of this element in order to name all important data of such a system.

Please provide any ideas.
