Hi!

The Problem with the code attribute as reference is that there is no information on the operatingPeriod of the train. This is exactly what Philip already adressed in his second question of his first post on this topic. So in my opinion the replacementOf should not be an attribute. It is a child element of the train and should reference either trainNumber + operatingPeriod or a tafTapTsiTrainID. For tafTapTsiTrainID there is no operatingPeriod needed the validity is already defined in the ID (https://wiki.railml.org/index.php?title=TT:tafTapTsiTrainID).

Best regards,
Leopold
