
Subject: Track: description vs. trackDescr

Dear all,

the element <track> has an attribute @description and a repeatable child element <trackDescr>, which both are based on datatype xs:string.

My questions to you: For which purpose do you use which description? Do you use the <trackDescr> at all? Can you provide us an example of a track with the different kind of descriptions?

Based on your feedback, we may update the wiki page [1] and close the Trac ticket [2]. If <trackDescr> is not used, we may also declare it DEPRECATED with railML version 2.4.
