
Subject: [railML 3] Location of platforms

Dear all,

we have the following doubt regarding the new element PlatformEdge which has been introduced in railML 3.2.

In particular we don't know how to specify the location of a platform edge, since elements of type PlatformEdge do not have children or attributes to do this. Elements of type Platform and PlatformEdges instead have a child of type linearLocation, but it is not clear how to use it since a Platform is a macro-object which can contain multiple PlatformEdges, while an object of type PlatformEdges is a container for all the objects of type PlatformEdge (which can have different locations).

What do you think?

Kind regards,
f.
