Hello, I'm Pierre Simon and I work for Infrabel which is responsible of the railway infrastructure in Belgium. We are developing a software for helping in the installation of the ETCS1 on the belgian railway. That's why we are now joining the railML community.

The first subject is : The representation of the identical signal

Usually, identical signals are installed at the exit of a grill (de:GleisHarfe). They are visible for the driver if the train is in the grill or even if it is on the main track.

We suggest to duplicate this signal for all the tracks where the driver will see the signal and add an attribute ('identicalSignal') to refer signals between each other. (Apparently this kind of signal is at least used in Belgium, Germany and Czech Republic).

[de: Fuer Gruppenausfahrtsignale wird ein Attribut benoetigt, das die einzelnen Signale miteinander verlinkt.]
