> pre-signalling distance before the place where the speed change applies?)

If there is a sign at the place where the speed change applies, a
<signal> element might be placed. The only thing missing in that concept
at the moment is the reference from the <signal> to the <speedChange>.

In [1] the proposed attribute "signalised" for the <speedChange> has
been discarded after the discussion with the other coordinators on
September 10.
