Subject: new version?
Posted by thomas.kauer on Tue, 20 Jan 2004 15:28:13 GMT

Hello,

I heard about some changes in the way connections and switches will be
implemented. So I'm curious to learn more about this and to see the actual

version of the infrastructure schema.

Further more I would like to know in which way the state of an element
(and its data) will be included.
i.e. will it be possible to say if an element is planned, in construction,
functional or out of order?
The data as names, coordinates and so on, can I tell if they are temporary
or confirmed?
In which way can I tell the quality of the data (i.e. the coordinates are
accurate to 100m or 0.1mm)?

For some uses you need to know also elements that doesn't belong to the
tracks itself, such as platforms (Bahnsteige).
How can I describe a platform (for example)?
How can I tell the length of the platform that can be used by passangers?
Note: that's not the same as it's physical length.

With best regards

Thomas Kauer
