Hello,

there are some new developments around the timetable schema. As Susanne showed in the last meetings, there are still unsolved issues around "operational trains" versus "commercial trains" and "splitting / joining". So I started a greater restructuring of the timetable schema. A first draft (Version 1.1-R1) could be seen on the developer side. There is also a handmade example included in order to get an impression.

Main changes are:

- "trains" as basic train parts with fix "formation" and "operatingPeriod"
- "trainGroups" for commercial/operational trains
- "routeOcps" instead of "timetableentries" and "entry" elements
- "routeSections" instead of "section" elements
- several discarded elements and attributes ("operation", "section", "intervalTrainID", ...)
- several renamings in "id" and "RefId" to use the common "tElementWithIDAndName", ...)
- some grouping of the attributes ("trainKind", "arrivalDepartureTimes", ...)
- new attributes "emptyRunning" and "shuntingTime" for rollingstock circulation purposes

Please have a look at all these changes and let's start a discussion about them. Or at least give me some feedback.

Kind regards,
Joachim
