Subject: [railML3.1|Simple Example] namespace clashes

Dear all,
when I tried to validate the railML Simple Example for railML v3.1 with XMLSpy I got an error
stating that the default namespace of the xml itselt does not match the target namespace of the
referenced schema.
The mismatch is in particular: 3.1 vs v3-1 in the relevant namespace urls.
I fixed it manually for now but it should be fixed in the file for future releases.

Kind regards

Dear Felix,

which files (example and schema) did you use?
I just checked the latest version of the schema available in the railML3
SVN trunk [1], which validated without errors. All target namespaces
should be "3.1" and not "v3-1".

Dear Christian,
seems that I mistakenly took the xsd from [1]
