Dear all,

in the current IL schema the basic type EntityIL is derived from common type
tElementWithIDandCode because
tElementWithIDandName includes not only @name but also language variants of it. This was not
desired for IL. However,
with tElementWithIDandCode the attribute @code stands for the element name. This might cause
some confusion especially
if @code would be required in TvdSection for identifying the set code of a track circuit.

Currently it would like this:
<rail3:ownsTvdSection isBerthingTrack="true" code="Arnau A02" id="A02T"
partialRouteReleaseTimer="PT1S"
isReliable="true" residualRouteCancellationTimer="PT90S">
 <rail3:hasDemarcatingBufferstop ref="bus02"/> <!-- reference to bufferStop in IS -->
 <rail3:hasDemarcatingTraindetector ref="tde02"/> <!-- reference to trainDetectionElement in IS
-->
 <rail3:relatedToTrack ref="trc02"/> <!-- reference to track in IS -->
</rail3:ownsTvdSection>

Regards,
Jörg von Lingen - Interlocking scheme coordinator

Subject: Re: @code as element name

In-between it was decided to change it throughout the interlocking schema, i.e.
EntityIL now comprises @name instead of @code. This shall avoid any confusion by
the users.

Best regards,
Joerg v. Lingen

Rollingstock Coordinator
