Subject: [railML3]: Element groups and Station indicator

Dear all,

currently the class <GenericTypes> contain a child <hasElementGroupType> with a
list of possible groups. In addition the class <StationIndicator> contains a
another list possible groups which includes the first list but is more exhaustive.

The intention was to classify element groups in a generic way by
<hasElementGroupType>. But are there really different group definitions of the
same type?

The <StationIndicator> is more for HMI, i.e. indication and commanding,
referring to element groups or other objects.

Question (1): Shall the two lists be the same?
Question (2): Is the generic classification of element groups really needed?
