Hello,

railML now references Dublin Core Metadata.

See <<http://dublincore.org/>> for more information about it.

railML uses "dc.xsd", so you get up to 15 different metadata elements.

You can use it, like shown in the example "TT\_CNL.xml":

```
<railml xmlns="http://www.railml.org/schemas/2007"
xmlns:dc="http://purl.org/dc/elements/1.1/"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.railml.org/schemas/2007
../schema/railML.xsd">
<metadata>
  <dc:title>CNL night train example</dc:title>
  <dc:creator>Joachim Rubröder</dc:creator>
  <dc:source>manually build</dc:source>
</metadata>
...
</railml>
```

Feel free to try and comment the new railML code.

Download SVN revision [165] from [assembla.com](http://assembla.com) as Zip Archive  
(ca. 900 KB):

< [http://trac2.assembla.com/railML/changeset/165/trunk?old\\_path=%2F&old=165&format=zip](http://trac2.assembla.com/railML/changeset/165/trunk?old_path=%2F&old=165&format=zip)>

Alternatively download folders "schema" and "examples" separately  
(smaller size):

<<http://trac2.assembla.com/railML/browser/trunk?rev=165>>

Kind regards ...

Susanne
