Subject: roles
Posted by Andreas Tanner on Thu, 15 Mar 2012 12:22:28 GMT

In RailML, we have different attributes and elements for roles:
- "owner" in InfraAttrGroups and "ownerChanges", both used for tracks
- "manufacturer" and "operator" (element) for vehicles,
- "operator" (attribute) for trainParts

I think it would be wise to introduce a dedicated type for "roles" and
provide slots for id references at the appropriate locations. Maybe a
string enumeration type would work for the names of the different roles.
Even better, we could provide container elements as used in the vehicle
classification everywhere.

Regards

Andreas Tanner.
