Hello all,

I agree that the description and the example should be the same.  
However, the term operational is used in different elements and I do not see that it is always used to specify an attribute that is associated with the train operator instead of the infrastructure manager.

The attribute was introduced in 2.2 in TRAC ticket #140 (<https://trac.railml.org/ticket/140>) and the description there says it is used for a 'bestellter Betriebshalt' which translates to 'ordered operational stop'. The corresponding change to the xsd shows the following annotation: 'the stop is requested by the infrastructure manager' I would interpret this to mean 'true = ordered by IM' and thus without a change to the XSD an update of the wiki example would be necessary to show a correct example.

Best regards,

Philip Wobst
