Hi Philip

As already discussed by email and as you have described in the forum post, our approach with a new attribute "replacementOf" would reference the @code attribute of an other railML file. That is in fact not the best way to make the reference, but I think the only one currently available with railML 2.3.

Regarding your question:

1. Reference to the train code: Already described above.
2. Partial replacement: At the SBB, each train part is planned with an own train number (@code). Thus, we should have no problems if the "replacementOf" attribute is a part of the "train" element. But I'm not the railML expert, perhaps there is a better solution that is also suitable for others.
3. Attribute namespace: Thanks, that's clear - my mistake.

Best regards and see you at the next developer meeting!

Mico
