Hi Philip

Thank you for the feedback! My understanding was also that there should be only one valid topologyReference for each register. But: In the case of the SBB, we could also write the reference date(s) in the attribute "entry". Something like that:

```
<topologyReference topologyRegister="UNO" entry="20170101,20170601"/>
```

In this case, we would no use the start and end date attributes. Other topology register may use the "entry" attribute to refer to a topology version. Example for two versions where the first one is valid from 2017-01-01 to 2017-06-01 and the second one from 2017-06-01:

```
<topologyReference topologyRegister="XYZ" entry="v1005" startDate="2017-01-01"  
endDate="2017-06-01"/>  
<topologyReference topologyRegister="XYZ" entry="v1006" startDate="2017-06-01"/>
```

Both ways would be suitable for us.

Best regards,  
Mico
