
Subject: Switch: usage of attribute @course

Dear all,

a standard question for railML newcomers is about the connection of tracks via switches and crossings in order to form a railway network. Some years ago, we created a Wiki page [1] for this topic. It became one of the most called railML wiki pages. However, some questions remained and I would like to bring the discussion here to the forum in order to find a final solution for upcoming version 2.4.

The situation:

A switch is situated in the beginning or the end of a track and may be connected to other tracks. See the following example:

```
<track id="tr01">
  <trackTopology>
    <trackBegin id="tr01_tb" pos="0">
      <connection id="tr01_c01" ref="tr02_c01"/>
    </trackBegin>
    ...
    <switch id="sw01" pos="0" type="ordinarySwitch">
      <connection id="sw01_c01" ref="tr03_c01" orientation="incoming"
course="left"/>
    </switch>
  </trackTopology>
</track>
```

The switch begin is located in the beginning of track "tr01". The main course of the switch is defined by the <connection> in line 4. The branching course of the switch is defined by the <connection> in line 8.

The problem:

The attribute @course may have the values "left", "right" and "straight". However, the choice of this value currently depends on the orientation of the track where the switch is located. The wiki page [1] shows this in four small figures (examples 1-4). Consequently, the same type of switch (with respect to its construction layout) may define its branch one time with course="left" and the other time with course="right" depending on the different orientation of the track where the switch is located.

The question:

I want to ask you if you understand the current implementation / understanding of railML track connection modelling or whether you support to change it in the future? Shall the choice of value for

@course depend on the orientation of the track or shall it be independent and just linked with the construction layout of the switch?

I am looking forward to receiving your comments. The main aspects of the discussion and the final solution will be tracked with railML Trac ticket #39 [2].
