Hello David,

rather late than never... As a matter of fact, we're preparing the interlocking cum signalling schema for railML3 that includes an abstract aspect-element. Given the fact that aspects are highly national, railML won't touch the UK or any other national aspect with a bargepole. What you'll get is a skeletal aspect that must be extended to national needs. This said, the focus is rather on speed signalling so the UK's signalling system may be the odd one out.

We prepared a simple test yard with some aspects and routes that work well for the French and German approaches.

Yours,

Bob Janssen
