Dear Dirk and RS community,

I retract my suggestion for @minimumStopTimeDoors. We might model it as a nor: extention if it is needed after all. I ask for all other suggestions to be implemented in railML2.4RS. I think we should not use the element term also in the attribute term, as this is redundant. For example use @openingTime and not @doorOpeningTime under element <doors>.

I thank Dirk for the extensive description for the composition of the regular stop time. We model similar, but not quite the same. This as in Norway the departure procedure starts 20 seconds before the published departure. So that in Norway published departure is equal to actual departure in a situation with no delay. We will come back to this issue at a later stage.
