Subject: Extension of tElementWithIDandDesignator and additional elementNumber
Posted by Heidrun Jost on Wed, 29 May 2019 17:08:34 GMT

Dear all,

in the functional infrastructure a designator and an external element
are defined within railML 3.

Thales need this in the same way for the interlocking: The designator is
already defined. We propose to change the maxOccurs to "unbounded" and
to add the designator also with an unbounded occurrence.

We are also need an elementNumber for interlocking elements defined at
EntityIL. As discussed with the IL coordinator (Mr Jörg von Lingen) this
should have the type nonNegativeInteger.

Is it possible to extend the data model in that way?

Best regards,
