Dear all,
I would like to add my point of view to the discussion:
- "whether you need to distinguish between "in-station" and "outside-of-station": yes, we did.
Several applications, one of them traffic monitoring system, need to know what is in and what is out.
- regarding how to model borders, I'm not sure we need to add a specific functional infrastructure element: is a border a physical element - e.g. a signal? There are several kind of signals already available.
What about using belongsToParent in order to determine what is within an operational point and what is out?

Thanks

BR

Fabrizio
