
Subject: [railML3]: Identification of Infrastructure Manager

Dear all,

so far the class "GenericInfrastructureManager" is based on EntityIL, which allows to give it a unique ID, add a name etc.

However, in the Common part we have the class "OrganizationalUnit", which is used just for this purpose. In order to avoid unnecessary duplicate information I suggest to change the base of "GenericInfrastructureManager" from EntityIL to EntityILref. Subsequently any <specificInfrastructureManager> will not have an ID or designation but just @ref for reference to the InfrastructureManager defined in the Common part.
