Subject: [railML3] Places/Service in rollingstock

Dear all,

for modelling the places and service provided by rollingstock we had a split way in railML2, i.e. using enumeration for specific items and (alternatively) the code number from TAP/TSI B.4.9039 respectively B.4.7161.

Comparing both variants it is obvious that none of them cover all. Thus the question is to do the modelling for railML3 in the same split way or to enhance the enumerations to cover at least all sensible items from the TAP/TSI code lists.
