I have three suggestions regarding the structure of the information:

1. The list of available services (tServiceCategoryListExt) should (also) be available under the places element. While some of the services may be available to all passengers in the vehicle, others may be bound to specific seats or compartments. For example WiFi may be available to all, but USB sockets only on the First Class seats of a divided coach.

1.1. I would then suggest to remove the sleeperWith... categories and rather add a shower (and a lavatory) value to the services enumeration.

2. We should separate accessibility information from the place category. Many of the proposed categories may or may not be accessible and suitable for wheelchair users. One could easily imagine special bistro seats or sleeper compartments for wheelchair users. On the other hand, folding seats or bicycle spaces do not necessarily imply accessibility and suitability for wheelchair users. Instead of duplicating many of these categories to render accessibility (category + categoryWheelchair), it would be better to have a separate attribute or element.

Best regards

David
