Dear all,

following adaptations linked with Trac ticket #393 (re-naming <area> into <genericArea> and introducing <workingArea> etc.) [1] I updated railML 2.5 solution proposal for the additional running time in Trac ticket #395 [2]. Please review and let us know if you discover issues to be discussed / corrected / adapted...

Further, one of the two challenges mentioned in my previous post remains and awaits your qualified feedback:
* A direction dependency as modelled with <additionalRunningTime>@dir is not feasible with areas that span over several tracks having different directions. How to cope with this situation?

Any kind of example or comment is highly appreciated...
