Dear Heidrun,

first thank you very much for providing additional 2 solutions for the described problem how to assign mileage changes on netElements.
In the 2nd solution using 1 spot location only, in my opinion there is a risk of misinterpretation, because it is not obviously clear,
if the spot location provides the line kilometer value before or after the kilometer jump.

Conclusion:
Comparing all 3 solutions provided by Christian and the 2 solutions provided by Heidrun, I prefer Heidrun's first solution, where a mileageChange is using 2 spot locations describing the identical location on the track, but each of both with different line kilometer values.
