Dear Christian,

thanks for your detailed answer. This sounds completely fine for me and it no problem as long as some positional data is given. But what if I would have something minimalistic like

```
<linearLocation id="trk1_lloc">  
  <associatedNetElement keepsOrientation="true" netElementRef="ne1"/>  
</linearLocation>
```

Here the @keepsOrientation gives me the information that the track should be defined from (ne1, 0.0) to (ne1, 1.0). If the intrinsicCoordinateBegin and End were present, this would be no problem without keepsOrientation.

However, without any (optional) positional information, it is difficult for me to determine the direction of the track.

Do you have a solution?

Thanks and best regards
Jan
