For information and compatibility with railML2, a new attribute @mountedOn (railML2.4nor is using the name @mounted) is wanted in the <signalConstruction> element. The main issue for this attribute will be information about how the signal is physical mounted. The attribute may be optional. Proposed enumeration values as in railML2.5:

MountedOn: The way the signal is physical mounted (optional; xs:string; patterns: other:w{2,})

• pole: The signal is mounted on a pole along the track
• gantry: The signal is mounted above the track
• wall: The signal is mounted on a wall
• ground: The signal is mounted on the ground
