---

The common and metadata classes are a xml structural artifacts and should not be in the ontology

<https://ontology.railml.org/#Common>  
<https://ontology.railml.org/#Metadata>

These classes are used as a xml element container in the xml file structure. But it serves no purpose in the ontology. If a railml file is constructed from a group of triples, the corresponding information to construct the common/metadata containers should be able to be retrieved from the data without the need for these class instantiations.
