Greetings,

in the last months I've been intensively looking at the
timetable-subschema of v2.0.
After exchanging some questions directly with Mr. Rubröder (thanks again
at this point!) I decided to ask further questions via this forum since
other railML-users might have similar questions.
Currently I am working on an interface specification based on railML 2.0
and even if i am not planning to use certain attributes I would like to
add them to the documention - hence I need to know their meaning. While I
can recognize most elements and attributes and much is already documented
there are still a few objects whose meaning I do not recognize:

Element "train", attribute "scope": What kind of scope can be defined
here? Looking at the "scope" attribute of the element "times" I would
suspect there is a semantic overlap with the attribute "processStatus" -
but maybe I am wrong.

Element "blockPartSequence", attribute "basicBlockRef": What is its
intended use?

Please help me out & thanks in advance!

Best regards
Christoph Krause
