With reference to posting #3841 "ISO RailDax TSI Telematics (TAF/TAP) mapping"

Telematics LocationSubsidiaryTypeCode defines two types of handover border operational types:
74 - Operational handover: Location where the responsibility for operation changes or can change between two involved IMs. Attribute of primary location.

75 - Planning handover: Location where the responsibility for timetable planning and path allocation changes or can change between two involved IMs. Attribute of primary location.

These two attributes are to my knowledge not available in railML3.3

Does anybody have a UC requirement for this?
