Subject: A train with ETCS?

Dear all,

for the usage of RailML in Austria in conjunction with the opening of ETCS on Westbahn line at the end of this year, we need to describe whether a train operates with ETCS or not.

Therefore, it is necessary to use the element <train>.<trainPartSequence>.<equipmentUsage> with its attribute 'type'. It has the type tNationalSystemsType. Now the problem:

tNationalSystemsType has everything - but no ETCS...

For the moment, it would be sufficient to extend the enumeration tNationalSystemsType with either one "ETCS" value in general or "ETCS Level 1", "ETCS Level 2" a. s. o. values.

The better solution would be to have a unification of
  - rail:etcs,
  - rail:nationalSystem,
  - rail:equipmentUsage.

All three lead to the same: A train protection system (Zugbeeinflussungsanlage). The 'nationalSystem' element is very good (with a very bad name - from my opinion) but why is 'etcs' outside 'nationalSystem'? (You do not really want to tell me that ETCS is international? No, since there is already the 'srsVersion' attribute...)
Both should be unified as "trainProtectionSystem" or such.

And the same type should be used
  - for vehicles,
  - at a train,
  - at a track,
all three in sequences: A vehicle can support non, one or more trainProtectionSystems, a track can support some trainProtectionSystems. Normally, a train would operate with none or one trainProtectionSystem only in one section, but there may also be two trainProtectionSystem with different tasks - one for securing the maximum speed, and another for securing the main signals. For instance, in Germany INDUSI and ZUB262 operate simultaneously in trains with tilting technology.

Would be nice if we could get
  - a short solution with RailML 2.2
  - a good solution with RailML 3.0…
;-)

Best regards,
Dirk.

There are two positions in the railML-Timetable-Tree for this kind of
information, both of which result in the same railML types:

timetable/trains/train/trainPartSequence/equipmentUsage
timetable/trainParts/trainPart/formationTT/equipmentUsage

It was introduced in the spirit of the ETCS ideology as train equipment
system. From the ETCS point of view there are for purpose different
levels (and not intended different SRS Versions) and historically other
national (train protection) systems it has to interact with. The
"national systems" are encapsulated in STMs (Specific Transmission
Modules).

That's the reason why railML defines ETCS (levels, SRS versions)
separated from "traditional" train protection systems as

"nationalSystems".

Already implemented.

> a track can support some trainProtectionSystems.

Partly implemented with "trainProtectionChange", in a non-harmonized
way across the sub-schemas. See also [1], influences [2]

We will fix this issue with the next major release.

train/trainPartSequence/equipmentUsage offers the possibility to define
multiple "equipment"s. I mean that there is no need to define the
securing policy for each system, it would be enough to enable ETCS at
this place. Both above mentioned German systems are already kept by the
enumeration list in the attribute "type".

We could add an "etcs" element with its attributes "aETCS" (from
Rollingstock), but then there is no information about an STM, the ETCS
could interact with. Otherwise the STMs would be defined as a "national
system" like already done with the "type" attribute. I'm not sure, if
all aspects are covered by this solution, I try to figure it out.

....
<equipmentUsage>
  <equipment type="Indusi60" uses="true"/>
  <equipment type="ZUB262" uses="true"/>
  <equipment uses="true">
   <etcs level0="true" level1="true"/>
  </equipment>
</equipmentUsage>

....

+1

How about the above approach?

Kind regards...
Susanne
