Subject: Required 'id' attributes (was: More detailed 'speed change' definitions) Posted by Susanne Wunsch railML on Wed, 07 Nov 2012 13:25:11 GMT View Forum Message <> Reply to Message

Hello Dirk and others,

The following aspect was quite overseen, sorry for that.

I changed the follow-up to railML.misc because of the more general topic.

Dirk Bräuer < dirk.braeuer@irfp.de> writes:

- > <speedChange id="sc3"...>
- >
- > Can we have the ,id' of a speed change as an optional attribute? Since
- > we have many, many speed changes and seldom the need to refer to them
- > I do (optionally) want to save some space and effort.
- \* The "id" attribute provides good facilities to fetch single elements (with its attributes and sub-elements) from an XML file irrespective of an existing reference in the XML file.
- \* There are other often-used XML standards that use the same mechanism:

```
e.g. GML (Geographic Markup Language)
```

This attribute is required for all GML objects irrespective any reference.

A huge amount of XML Schemas in the Geographic field of application

base on the above mentioned XML Schema.

\* It is already a very smart implementation for identification.

The following example shows up a typical alternative from the banking sector:

<act:id type="guid">aa671349a0befafcfff1773e42eb8a49</act:id>

\* There are algorithms for different programming languages for the ID-generation in general.

e.g. generate-id() in XPath (staying at the XML-world) ;-)

\* The \_required\_ attribute may only be changed into "optional" for the next major release.

I hope it clarifies the issue a bit.

Kind regards...

Susanne

Crosspost & Followup-To: railML.misc

Dear Susanne,

thank you for the reply.

Some of the aspects on 'id's in RailML

> \* There are other often-used XML standards that use the same mechanism:

Yes, of course, all strict-relational data models do so. (Strict-relational data models need to have Id's.)

In RailML, we also have some hierarchy (so RailML is not strict-relational) and, more important, we do not know about the data model of the reading/writing software. So I would say it is bad to force it to strict-relational data models.

Additionally, we do not have 'id's at each <elements>, so the selection of elements with id (out of all elements) is a rather arbitrary one. If your arguments would be accepted: Wouldn't we need to provide 'id's at all <elements>, would we?

So to come out of this current "arbitrariness" I thought about the rule "no 'id' without a 'ref' to it". So: If we need a reference, we have to provide both 'id' and 'ref'.

That would lead us to a rather logic structure: Hierarchy (<elements>) combined with non-hierarchic references with 'id's.

The question on the meaning of 'id's in RailML (as a primary key for relational data models) is a more general one - not specially on speed changes, so I will end this arguing here and open a new topic at "misc".

Best regards, Dirk.

- > your arguments would be accepted: Wouldn't we need to provide 'id's at
- > all <elements>, would we?

That's a good remark and actually I prefer defining IDs for all elements within a railML file instead of marking existing IDs as optional parameters. However, as Susanne already mentioned, this is a topic for railML 3.0.

Regards
