Subject: XML list files in an element-centric structure (was: small issues on "register" and "tLineInfrastructureManagerCode")

Dear Dirk and others,

I want to discuss the general structure of separate XML files as replacement for schema-internal enumeration lists in this 'misc' forum because it concerns all sub-schemas.

Susanne Wunsch <coord@common.railml.org> writes:

I would like to introduce this new style with the separate XML files. There are good reasons for attribute-centric and good reasons for element-centric schemas. These discussions were held in dozens of newsgroups, mailing lists and web-forums for various domains. It's not a railway-specific issue. It's a general XML-style issue. Therefore I would adopt the recommendations of these two conclusions of well-known XML experts. [1] [2]

What would change for the railML style?

\* Promote all attributes to elements, despite of the following

@id, @code, @xml:lang

That change is currently only proposed to the XML list files. The railML schema files keep unchanged.

Any comments, questions, concerns, +1, -1 ... appreciated.

Kind regards...

Susanne

Dear Susanne,

thank you for providing the possibility to take part at this important decision.

To make it short: I opt for keeping the current philosophy of usage of attributes and elements. I opt for still using attributes for simple, base-type information.

In general: The reason for my opinion is the file size: With elements a file is bigger than with attributes because of the repeating of the element names. Due to a simple file-size proportionality, the processing of element-like files tends to be longer than that of attribute-like files. We already have very large RailML files with processing times sometimes of some minutes (!) and I do not want to get a problem with file size or processing times in future.

But I am aware that there are many arguments for both solutions and I also do not want to start this discussion again here. So this should be a simple vote in a democratic manner without much arguing.

In specific: If RailML 3.0 or 10.0 or whatever would change all the existing attributes to elements (even if except the three you named), we possibly wouldn't be able to use that RailML schemes because I think it is too much effort to change all the existing programming for iRFP and for all our partners. So here in particular I opt a little bit "stronger" for keeping the structures and philosophy we already have.

With best regards,  
Dirk.
