Dear all,

during recent RailML conference in Zurich I have presented the current status of the rollingstock scheme (V0.94). I have received only one suggestion to add an attribute for storing the vehicle kinematic envelope, i.e. its name as reference. This I will incorporate as optional string at the <wagon> element.

The plan was agreed to release the scheme as version 1.0 by beginning of April. If there any comments or suggestions please forward them in time in order to be considered for the upcoming release consolidation.

Regards

Jörg von Lingen
