Subject: forgotten attribute <operatingPeriod> @dayOffset and its future

Introduced with railML 2.2, there should be a new attribute @dayOffset at <operatingPeriod>.

It now turned out that this attribute seems simply to have been forgotten.

(The attribute with the same name at <blockPartSequence> is already there since railML 2.0 and therefore no mistake.)

So obviously nobody has missed this attribute and the question arises, whether we should still introduce it and/or transfer it into railML 3.x.

There is a lengthy explanation of this attribute in [1] including several reasons for its introduction. So my suggestion is to introduce @dayOffset at <operatingPeriod> from r2.4 AND transfer it into r3.x.

@Stefan Jugelt: I know several infrastructure managers who do not allow "departureDay=1" at the first <ocp> in their data models. How does ERA deal with this issue? Is there a kind of "dayOffset" in TAP/F TSI, too, or is there "departureDay=1" allowed from the start?

Best regards,  
Dirk.

Hello Dirk,

I do not agree with need to add this attribute in r2.4. Due to the fact that it seems to not have been used at all in any r2.2 interface should rather mean we remove the attribute in the Wiki in a transparent way and then review the need for this attribute in r3.x

Best regards,

Philip

Dear Philip,

the fact that the attribute has not been used so far does not mean that there is no demand on it. I think simply the programming lags behind several years. That's normal.

I can remember that there was an original problem to introduce this attribute and a lengthy discussion between <TT> developers at a meeting. I want to respect the earlier decision. I think this is important also in general, to give the developers stability and "protection of investment".

However, if you want to waive the attribute, that means to allow departureDay<>0 at first <ocpTT>. No problem of technology from my side, but as I said, there are several infrastructure managers who do not allow it in their data models. So could we please clarify first what ERA says to this problem in their recommendations? I think it is not reasonable to let railML walk into a different solution than ERA.

Best regards,  
Dirk.

Dear all,

there has been no further feedback regarding the need of this attribute in railML 2.4. The description will be removed from the wiki.

Best regards,

Philip Wobst

Dear all,

there has been no further feedback regarding the need of this attribute in railML 2.4. The description needs to be removed from the wiki on the following pages:

[https://wiki.railml.org/index.php?title=TT:Midnight\\_overrun](https://wiki.railml.org/index.php?title=TT:Midnight_overrun)

<https://wiki.railml.org/index.php?title=TT:operatingPeriod>

<https://wiki.railml.org/index.php?title=TT:times>

Best regards,

Philip Wobst

Dear all,

I adapted the wiki pages listed below. The changes have not been published yet, but can be found under "Pending changes" on each article page. It was not enough to only remove the paragraphs concerning the obsolete attribute, I also had to rearrange and merge several paragraphs to preserve a consistent structure of the article, so my changes were a little bigger than expected.

I also replaced two references to the iRFP document

"[http://www.irfp.de/download/railml\\_beispiel\\_mueg.pdf](http://www.irfp.de/download/railml_beispiel_mueg.pdf)" (RailML-Beispiel zu Mitternachtsübergängen) because its content is already available in the wiki article [http://wiki.railml.org/index.php?title=TT:Midnight\\_overrun](http://wiki.railml.org/index.php?title=TT:Midnight_overrun)  
For details of the changes please see my comments under "View history".

Kind regards

Christian Rößiger

Dear all,

Respecting the input from our telephone conference today I reworked the article [https://wiki.railml.org/index.php?title=TT:Midnight\\_overnrun](https://wiki.railml.org/index.php?title=TT:Midnight_overnrun) again. (My changes can be seen under "Pending changes").

Kind regards

Dear Thomas,

thank you for your good analysis of my posts on this topic over several years. I still think there is a misunderstanding:

- It is true that in 2012, I argued for throwing away of the attribute @dayOffset at <operatingPeriod> for the sake of less redundancy.

- In [1], there are arguments against the usage of shifted <operatingPeriod>s in the section "Why not use shifted/rotated <operatingPeriod>s".

- So what to do after midnight when there is no attribute @dayOffset at <operatingPeriod> and shifting of the <operatingPeriod> is not wanted? The only solution left is using departureDay<>0 at first <ocpTT>. And for this, I already wrote on 09.06.2017 and 21.06.2017:

- > No problem of technology from my side, but as I said, there are several infrastructure managers who do not allow it in their data models.

So again: We can live without the attribute @dayOffset at <operatingPeriod>, but that means allowing departureDay<>0 at first <ocpTT>. This is less redundancy but more incompatibility to other data models of infrastructure managers who expect departureDay!=!0 at first <ocpTT>.

Unfortunately my direct question to Stefan Jugelt of ERA, how is it done in TAP/F TSI, was not answered yet.

So as there seems to be no current problem, I think we can leave it for now and can come possibly back to that discussion in railML 3.x timetable operating periods.

Best regards,  
Dirk.

There will always be data models out there that differ from the railML data model. As long as we can reflect the information that those data models need, I don't see a problem. In this case, a system with a native data model that differs from railML can simply add/subtract/shift on import/export. Creating redundancy in the model to be closer to more native data models makes import interfaces more complicated for everyone.

Best regards,  
Thomas Nygreen - Common schema coordinator, railML.org
