Hello,

for ETCS purposes we need the following additional track elements:

```

                                     |---- RadioHole
                                     |
                                     |---- NonStoppingAreas
                                     |
TrackElements ----|---- TrackConditions ---|---- AirtightnessChange
                   |
                   |---- Powerless
                   |
                   |---- SwitchOffBrake
                   |
                   |---- LevelChange
                   |
                   |---- RBCChange
                   |
                   |---- SHChange
                   |
                   |---- MetalMasses
                   |
                   |---- ETCSBorderChange ---|---- Adhesion
                   |
                   |---- RadioInfillArea
                   |
                   |---- Reversing
                   |
                   |---- TrackAheadFree
```

The above described new track elements are classified into two parts.
TrackConditions represents common conditions for track elements.
ETCSBorderChanges represent special ETCS requirements.

Best regards,
Heidrun Jost
