Both detector@detects in Infrastructure and hasDetectorType@detectorType in Interlocking should be considered. detects="derailment" is missing and "avalanche" is defined for both attributes. How shall an avalanche area be defined? See the attached document for more details and examples.

Dear Georg,

thank you for your feedback on railML 3.2 and the detector element in particular. Indeed, the first implementation of the detector in railML 3.2 has still some potential for improvement harmonizing the aspects in IS and IL schema. Therefore, I filed a Git issue [1] in our railML development system in order not to forget about this topic in railML 3.3.

Question to the railML community: which kind of additional requirements do you have regarding the modelling of incident and natural hazard detectors? Any comment is highly appreciated...

Dear Christian,

For a joint Norwegian (Bane NOR and Jernbanedirektoratet) suggestion on how to handle this topic, see the following forum post:  
<https://www.railml.org/forum/index.php?t=msg&goto=3190>.

Best regards
